**Abstract:** In the growing busy life of people, taking care of the houseplants has become a tough task. Professional life has taken such a toll on our lifestyle that taking care of houseplants is of least priority. This paper devises a new approach to solve this problem, which monitors the temperature, humidity, soil moisture and waters the plant remotely. Apart from all these functions, this paper also discusses an approach to visualize the data obtained by the sensors through pie charts and bar graphs.

**Index Terms:** Arduino, AWS IoT, Raspberry Pi, Remote plant watering, Soil moisture sensor, Temperature and Humidity sensor, Water level sensor

## I. INTRODUCTION

In today's life, it has become a tedious task to take care of plants at home and hence, the authors have come up with a system which can tackle this problem. Growing plants is a time consuming and effort taking duty as watering them is a daily task that is needed to be done to keep the plants alive. It is very usual that people often leave the plants to their own and this becomes worse when they go out of station. In such circumstances, they take help from a third person or they simply give up growing them.

Remote plant watering and monitoring system can help people with growing and monitoring it. As the system is remotely controllable, the owner can moderate the watering according to the atmospheric conditions existing at that point of time. Remote plant watering and monitoring system waters the plant, monitors the temperature and humidity of the surroundings, measures moisture of the soil and estimates the amount of water required for the plant and waters the plant remotely.

It further stores all data in Dynamo DB through AWS IoT. The data so collected is visualised using graphs and charts to give a better understanding of the plant's life and watering statistics to the user. All the sensors, actuators and water pump are controlled by Raspberry Pi running a nodejs application. For this requirement, the proposed system prefers to use Johnny-Five library. To communicate with Amazon Web Services, the authors used AWS IoT SDK for javascript.

## II. BLOCK DIAGRAM

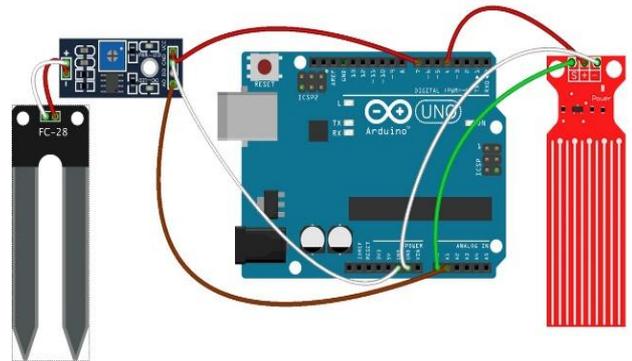

Fig. 1: Block diagram of Arduino

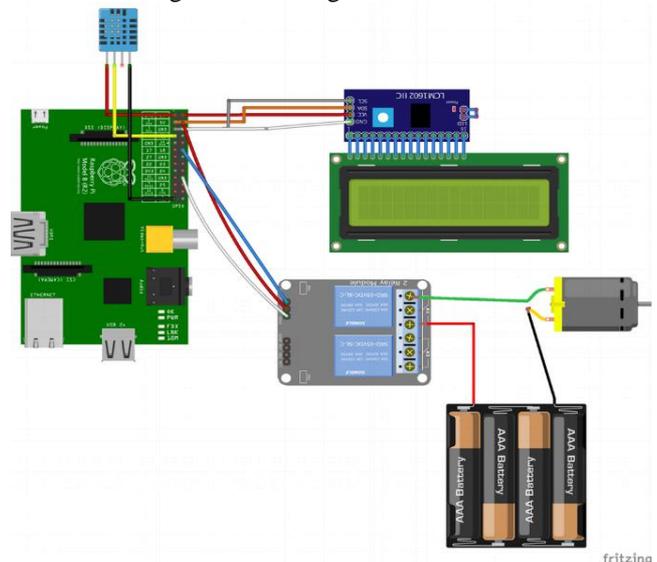

Fig. 2: Block diagram of Raspberry Pi

Hardware components:

1. Raspberry Pi 1 Model B
2. Arduino UNO
3. DHT11 Temperature & Humidity Sensor
4. YL-69 Soil Moisture Sensor
5. Water Level Sensor
6. Standard LCD 16x2
7. Water Pump Motor
8. 5V Relay
9. 4xAA battery holder

### III. SOFTWARE IMPLEMENTATION

#### Initializing Dynamo DB

Dynamo DB stores the data collected by sensors. Go to Dynamo DB website.

Create a new table with the following attributes:

- Table Name: remotewater\_sensor\_data
- Partition Key: key
- Click 'Add Sort key', add timestamp

Note: Data type of key and timestamp must be String.

#### Initializing AWS IoT

Open a web browser and go to AWS IoT Console Page.

Follow the steps below:

- Create a 'thing' with the name 'raspi-water-pump'
- Create a new policy with the name pump-policy, Action iot:\*, resource \*. Select Allow, click 'Add statement' and then click 'Create'.
- Create a certificate by using 'one-click certificate create'. Download the public key, private key, and the certificate.
- Select the created certificate.
- Perform the following procedure:
  - Click 'Actions' > Activate button the certificate
  - Click 'Actions' > Attach a policy and name it as 'pump-policy' which was created and click 'Attach'.
  - Click 'Actions' > Attach a thing with the name 'raspi-water-pump', Click 'Attach'.

Create a 'rule' with the following values:

- Name: storeInDynamoDB
- Attribute: \*
- Topic Filter: sensor/data
- Choose an action: 'Insert message into a database table'
- Table name: remotewater\_sensor\_data
- Hash key value: \${topic() }
- Range key value: \${timestamp() }
- Role Name > Click 'Create a new role'.
- Click 'Allow' button from the next page that will open up and select it from Role Name dropdown

### IV. HARDWARE IMPLEMENTATION

#### A. Initializing Arduino

The values received from Water level sensor, and soil moisture sensor are analog. Connecting them directly to Raspberry Pi can be inefficient, hence we prefer to use Arduino to input analog values from these sensors and then send them to Raspberry Pi as digital values. Raspberry Pi updates the Arduino source code.

Connect the Arduino to PC and upload Standard Firmata.

Procedure to upload Standard Firmata:

- Open Arduino IDE on your PC
- Go to File > Examples > Firmata > Standard Firmata
- Upload sketch to Arduino (Ctrl+U)

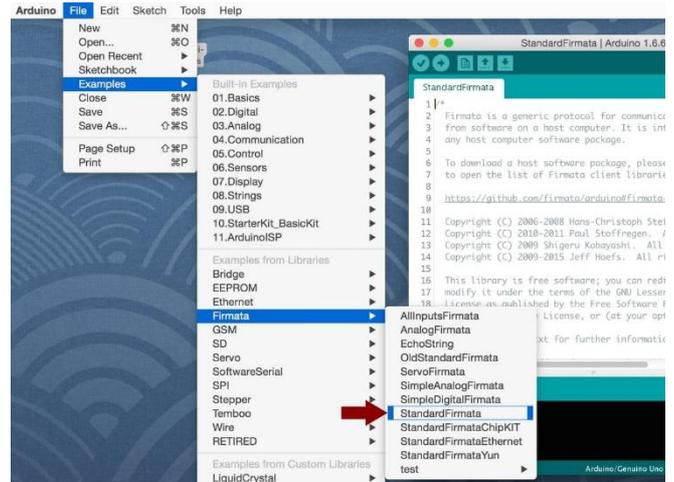

Fig. 3: Standard Firmata example on Arduino IDE

Connections between Soil Moisture and Arduino should be done in the following manner:

- PIN 7 ----> VCC (power)
- GND ----> GND (ground)
- AO ----> (analog output)

Connections between Arduino and Water level sensor should be done in the following manner:

- PIN 4 ----> (+)
- GND ----> (-)
- A0 ----> S

Next, use a USB cable to connect Arduino with Raspberry Pi.

Place the water level sensor in the water tank and soil moisture sensor in the flowerpot.

#### B. Initializing Raspberry Pi

Connect Raspberry Pi with LCD screen, DHT11 temperature & humidity sensor and relay to switch water pump.

Connecting DHT11 temperature & humidity sensor to Raspberry Pi

- GPIO4 (PIN 7) ----> S
- 3V3 (PIN1) ----> (+)
- GND (PIN 25) ----> (-)

Connecting LCD Screen

- 5V (PIN2) ----> VCC
- GND (PIN6) ----> GND
- GPIO2 (PIN 3) ----> SDA
- GPIO3 (PIN 5) ----> SCL

Connecting Relay to switch Water pump

- GPIO18 (PIN 12) ----> S
- 5V (PIN4) ----> (+)
- GND (PIN 20) ----> (-)

Connecting the battery and relay to the water pump.

- Out of the two wires present on water pump, one must be wired to relay, the other with battery pack cable.

- The freebattery cable must be connected to the relay.

Refer to Figure 2.

## V. RESULTS AND CONCLUSIONS

### A. Output in DynamoDB table

We run the nodejs application on Raspberry Pi to collect sensor data and control the water pump remotely. Internet connection to the Raspberry Pi is necessary.

Either Ethernet or WiFi would suffice the purpose.

Node should be installed on Raspberry Pi before following with the procedure further.

Connect the Raspberry Pi and run the following command:  
`git clone git@github.com:demirhanaydin/waterpi-node.git`  
`cd waterpi-node`  
`npm install`

Go to AWS IoT page, download the public key, private key, and certificate files, and place them under certs folder. Download the root CA certificate file from root certificate. Save the file as rootCA.pem and place it under 'certs' folder.

Open device.js file with a text editor and update the following lines with the file paths. Get the IOT\_DEVICE\_URL from AWS IoT platform by clicking the thing that was created. It should be like `https://XXX.iot.us-east-1.amazonaws.com` where XXX is the IOT\_DEVICE\_URL.

Run the following command:  
`sudo node index.js`

On the successful completion of the above procedure, sensor values will be printed on the LCD screen.

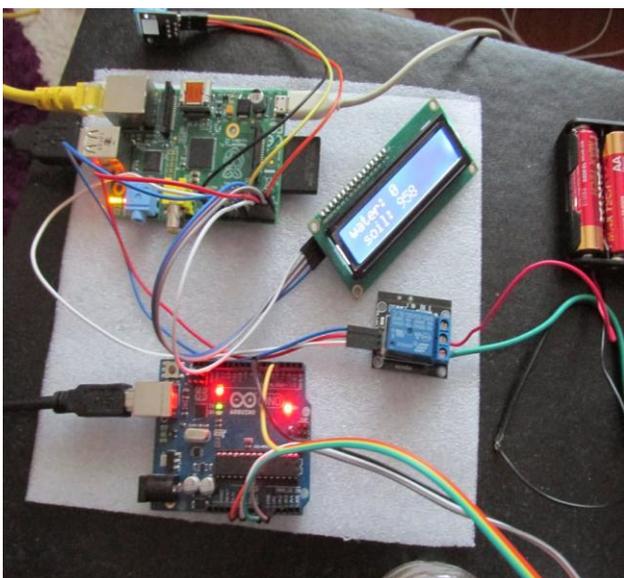

Fig. 4: Sensor values on LCD screen

Fig. 5: Temperature and Humidity values on LCD

The values can further be seen on the DynamoDB table. The application sends sensor data to IoT platform every 20 seconds.

key	timestamp	payload
sensor/data	1452850514...	{ "hum": { "N": "51"}, "sol": { "N": "960"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	14528505713...	{ "hum": { "N": "50"}, "sol": { "N": "962"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	14528505914...	{ "hum": { "N": "50"}, "sol": { "N": "931"}, "temp": { "N": "22"}, "wat": { "N": "339" } }
sensor/data	145285051111...	{ "hum": { "N": "50"}, "sol": { "N": "922"}, "temp": { "N": "22"}, "wat": { "N": "276" } }
sensor/data	145285051311...	{ "hum": { "N": "50"}, "sol": { "N": "971"}, "temp": { "N": "22"}, "wat": { "N": "16" } }
sensor/data	145285051512...	{ "hum": { "N": "50"}, "sol": { "N": "973"}, "temp": { "N": "22"}, "wat": { "N": "4" } }
sensor/data	145285051713...	{ "hum": { "N": "51"}, "sol": { "N": "977"}, "temp": { "N": "22"}, "wat": { "N": "3" } }
sensor/data	145285051916...	{ "hum": { "N": "51"}, "sol": { "N": "976"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285052118...	{ "hum": { "N": "51"}, "sol": { "N": "976"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285052315...	{ "hum": { "N": "51"}, "sol": { "N": "976"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285052518...	{ "hum": { "N": "51"}, "sol": { "N": "973"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285052717...	{ "hum": { "N": "51"}, "sol": { "N": "967"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285052916...	{ "hum": { "N": "51"}, "sol": { "N": "972"}, "temp": { "N": "22"}, "wat": { "N": "0" } }
sensor/data	145285053110...	{ "hum": { "N": "51"}, "sol": { "N": "966"}, "temp": { "N": "22"}, "wat": { "N": "0" } }

Fig.6: Sensor values on DynamoDB table

### B. Output on web application

The web application visualizes the data present on DynamoDB table by using charts. The web application can also control the water pump remotely. Whenever the user clicks 'Start' or 'Stop' button, it registers an event to AWS IoT platform. Raspberry Pi inputs this event and processes it starts or stops the pump as per the user action.

Install Ruby on the computer to continue with the procedure further.

Open the Terminal and run the following commands:  
`git clone git@github.com:demirhanaydin/waterpi-web.git`  
`cd waterpi-web`  
`bundle install`

Place the public key, private key, certificate, and rootCA files under 'certs' folder. Open boot.rb and update the lines

with adequate values.

Note down the access key and secret key from Security Credentials page on AWS Management Console.

Run the project with:  
ruby app.rb

Open a web browser and go to <http://localhost:4567/>  
Collected sensor data from DynamoDB will be available in the form of charts.

Fig.7: Web interface of the 'Remote plant watering and monitoring system based on IoT'

In this paper, the authors have successfully demonstrated the practical implementation of Remote plant watering and monitoring system based on IoT.
