Abstract: In this paper modelling, simulation and control of grid tie PV system using multilevel inverter are described. The majority of PV systems require inverters as interfacing units. A reconfigurable single phase inverter topology for a hybrid ac/dc solar powered home is suggested here. This inverter possesses a single-phase single-stage topology and the main advantage of this converter is that it can perform dc/dc, dc/ac, and grid tie operation, thus reducing loss, cost, and size of the converter. This hybrid ac/dc home has both ac and dc appliances. This type of home helps to reduce the power loss by avoiding unnecessary double stages of power conversion and improves the harmonic profile by isolating dc loads to dc supply side and rest to ac side. Simulation is done in MATLAB/Simulink and the obtained results are validated through hardware implementation using Arduino Uno controller. Such type of solar powered home equipped with this novel inverter topology could become a basic building block for future energy efficient smart grid and micro grid.

I. INTRODUCTION

Due to increasing power demand many new alternatives of power generation are used effectively. Out of all these photovoltaic generation is effective and can easily be implemented. The power from the PV system have different outputs depending on the condition of temperature and irradiance. To extract maximum power from PV array different MPPT algorithms are available such as, perturb and observe (P&O), incremental conductance (INC) and many more. Out of all these INC have some advantages and commonly implemented in many PV applications. This mppt controller is used to extract maximum power under all the irradiance conditions using boost converter. The output of PV system serves as DC link for the inverter. A power controlling method is employed to synchronize the PV system with grid. Generally, there are 2 main power stages in a grid tie PV system. First is DC link voltage control stage that maintains constant DC link voltage across inverter input and second stage consist of inverter current control that controls the current injected into the grid. Current control can be employed in many reference frames such as, stationary reference frame (a-b), synchronous reference frame (d-q) and natural reference frame (a-b-c). In the proposed system synchronous reference frame is employed using proportional integral (PI) controller.

II. SOLAR PHOTOVOLTAIC ARRAY

The Solar Photovoltaic Array is formed by connecting several solar panels in series and parallel combination to generate the required power. The smallest component of the solar photovoltaic array is called photovoltaic(PV) cell. The ideal solar photovoltaic cell is represented by the equivalent circuit shown in Fig 1. These cells are connected in series of 36 or 72 cells to form one module. Similarly, several modules are assembled into a single structure to form array. Finally, assembly of these photovoltaic arrays are connected in parallel to obtain the required power. In PV module, series resistance ($R_s$) is comparatively more predominant and $R_{sh}$ is considered equal to infinity ideally. The open circuit voltage($V_{oc}$) of the PV cell is directly proportional to solar irradiation and $V_{oc}$ is inversely proportional to the temperature.

The PV Array is characterised based on the I-V and P-V characteristic. As we can see from Fig.2 and Fig. 3, the variation in irradiation result variation in the current and the curves of I-V characteristic vary largely for different level of irradiation. The irradiation directly affects the PV Array current while the change of temperature directly affects the voltage generated by the PV Array as shown in Fig. 4 and Fig. 5. So same observation we can made from the below graphs of I-V and P-V characteristics at different irradiation and temperature level.
Single-Stage Solar PV Inverter for Small-Scale Systems

Compared to the single-stage one, the multistage power conversion is somewhat more expensive and affects the efficiency of the PV inverter. To reduce the volume and weight as well as the power conversion loss and cost, a hybrid PV battery-powered DC bus system was proposed in 2009 [2]. The DC to AC conversion stage-less DC bus system is very applicable to electronic equipment and appliances with high system efficiencies. The PV-battery-powered DC bus system is shown in Fig. For AC systems, a single-stage PV inverter was proposed in [2], and the circuit topology of single-stage inverter is shown in Fig. The proposed inverter performs a dual function: MPPT and outputting a sinusoidal current, which makes the control circuit complex. In [2], an alternative control technique was developed to reduce the complexity of the control circuit. However, the common-mode issue was not considered in the proposed single stage inverter systems. The neutral point clamped (NPC) converter topology has the opportunity to connect the grid neutral point to middle point

\[ V_A = \sqrt{2} V_{rms} R \ldots (1) \]

Therefore, a few PV arrays in series connection are necessary to obtain the desired voltage. From the available literature, several single-stage topologies have been proposed based on either boost or buck–boost configurations.

An integrated (boost converter and full-bridge inverter) PV inverter circuit topology shown in Fig. was presented in [3]. The output power quality and the efficiency of the inverter are limited by the fact that the boost converter cannot generate the output voltage lower than the input voltage. A universal single-stage PV inverter shown in Fig. was presented in that can operate as a buck, boost, or buck–boost converter. This inverter can operate with a wide range of input voltage, improving the power quality and the efficiency. Using the integrated buck–boost and inverter functions, several modified configurations have been presented in [3]. However, these topologies are only suitable

**III. RECONFIGURABLE SOLAR CONVERTER**

Conventional grid connected inverter uses high dc link voltage, which will be the peak magnitude of the line-line grid voltage [1]. For this particular purpose, two stage conversions are required to boost up the dc voltage and to invert it. However, this will increase the cost, size, and loss of the system. To avoid this, single-phase single-stage topologies of inverter are suggested in [1]–[2]. In the single-phase inverter topology, transformer less inverter gained significant research interest as suggested in [1]. Transformer less inverter has the advantage of low size and cost by avoiding the transformer but this will eliminate the galvanic isolation and inverter will become very sensitive to grid disturbances. The solar PV is limited by its inherent intermittency aspects and, hence, battery storage (assumed here) is required to supply the power when there are not enough solar radiations. But having a separate converter for battery’s power management system will increase the cost and size of the converter as well. Hence, a three-phase topology of reconfigurable solar inverter is introduced in [1] and [2] for utility PV system with battery storage. This reconfigurable system is suitable to solar and wind farm applications. This topology is tested with a new algorithm and validated the results. Normally, every solar powered household have a battery system to provide a reliable supply system. These batteries are charged when connected to ac system or they need a separate converter to manage the charging operations when it connected to dc supply side.

**IV. CONTROL OF THE PROPOSED CONVERTER**

For controlling this proposed single-phase inverter, PQ controllers used considering the advantage that it will
control the active and reactive power according to the reference signal. Since the controlling elements for the ac system are very difficult due to their time-varying nature, the ac control variables are converted to a stationary reference frame from a rotating reference frame for effective control [1].

Let \( F_{\beta} \) be the rotating reference frame variables, which can be voltage or current, whereas \( F_d \) and \( F_q \) are stationary variables. In rotatory reference frame, the active and reactive powers can be calculated by using

\[
P = \frac{1}{2} [v_d \times i_d + v_q \times i_q] \quad \text{(1)}
\]

\[
Q = \frac{1}{2} [v_d \times i_q - v_q \times i_d] \quad \text{(2)}
\]

Where \( v \) and \( i \) are the instantaneous values of voltage and current, respectively.

When the inverter is synchronized to the grid, the value of \( v \) becomes 0, and (1) and (2) becomes

\[
P = \frac{1}{2} [v_{\beta} \times i_{\beta}] \quad \text{(3)}
\]

\[
Q = \frac{1}{2} [v_{\beta} \times i_q] \quad \text{(4)}
\]

The active and reactive reference currents are given in (5) and (6) as

\[
\hat{i}_d = \frac{2}{v_d} \hat{P} \quad \text{(5)}
\]

\[
\hat{i}_q = \frac{2}{v_d} \hat{Q} \quad \text{(6)}
\]

Where \( P \) and \( Q \) are the reference power signals of active and reactive power, respectively.

Calculated values of \( i_d \) and \( i_q \) are converted into stationary reference frame and given as signal to PQ controller to produce reference signals for the sinusoidal pulse width modulation controller. Synchronizing the solar inverter with grid requires the knowledge of the magnitude and phase of the grid supply voltage. Phase lock loop (PLL) will track the phase of the grid and help to synchronize with the grid. To obtain maximum power from the solar panel, according to maximum power transfer theorem, the panel resistance should be equal to the load resistance, which is connected to this panel. To achieve this, a hill climbing MPPT algorithm is used. This technique will equalize the resistances and extract maximum power from the solar panel.

**V. MODELLING AND SIMULATION**

A 30 KW panel is considered as consisting of 24,080 solar cells arranged in 344X70 combinations. The solar array consists of number of panels connected in series-parallel configuration and a panel consists of number of cells. The power characteristics of the solar cell are formulated using its equivalent circuit. The equivalent circuit of the cell is presented as a current source in parallel with diode and a parallel resistance with a series resistance [6].
The output current can be measured by subtracting the diode currents and current through resistance from the light generated current. From this circuit, the output current of the cell is expressed as,

\[ I = I_{pv} - I_d - I_{Rsh} \]  

(1)

\[ I = I_{pv} - I_0 \left[ \exp \left( \frac{V + IR_s}{a} \right) - 1 \right] - \left( \frac{V + IR_s}{R_p} \right) \]  

(2)

Where, \( a = \frac{N_s A K T_c q}{N_s A V_T} \) = \( N_s A V_T \frac{I_{sc} + K_v \times dT}{\exp \left( \frac{V_{oc} + K_v \times dT}{aV} \right) - 1} \)

Where, \( n_s \) are numbers of cells connected in series. The output current of the solar panel is \( I \). The light generated current is \( I_{pv} \). Saturation currents through diodes are \( I_0 \). The voltage at output of panel is \( V \). Series resistance of cell is \( R_s \) which represents the internal resistance of cell and it is considered as 0.55 \( \Omega \). The Boltzmann’s constant is \( K \) (1.38 \( \times \) \( 10^{-23} \) J/K). Ambient temperature (in Kelvin) is \( T \) and charge constant is \( q \) (1.607 \( \times \) \( 10^{-19} \) C).

A 30 KW solar-PV array is realized considering 24,080 cells (344\( \times \)70 dimensions) using (1)-(2). A Matlab model for the same is developed.

VIII. CONCLUSION

As shown in the graph the P-V and I-V characteristics of PV system changes as per the change in temperature as well as irradiation. So, the PV Generation is very sensitive to any change in the value of temperature as well as irradiation. So accordingly, the output values of all the components connected will be directly affected to this variation. To achieve maximum power point, we can control the current or regulate the voltage to maintain the power. In the proposed system, MPPT regulates the duty cycle to maintain voltage and achieve maximum power. This paper also highlights the future developments, which have the potential to increase the economic attractiveness of such systems and their acceptance by the user. This paper also represents the modelling and Simulation of Solar PV System using MATLAB-
SIMULINK software. The Simulation results show the ideal I-V and P-V characteristics of the solar PV system.
